We claim:

- 1. A method to facilitate conducting an Internet protocol session comprising:
- retrieving from memory at least one temporary Internet protocol session parameter as corresponds to a node;
- using that at least one temporary Internet protocol session parameter to facilitate initiation of an Internet protocol session with the node.
- 2. The method of claim 1 wherein retrieving from memory at least one temporary Internet protocol session parameter as corresponds to a node comprises retrieving from memory a temporarily assigned Internet protocol address as was recently previously assigned to the node.
- 3. The method of claim 2 wherein retrieving from memory a temporarily assigned Internet protocol address as was recently previously assigned to the node comprises retrieving from memory a temporarily assigned Internet protocol address as was recently previously assigned to the node and not then yet subsequently returned to a pool of available temporary Internet protocol addresses.
- 4. The method of claim 1 wherein retrieving from memory at least one temporary Internet protocol session parameter as corresponds to a node comprises retrieving from memory at least one point-to-point protocol session parameter.
- 5. The method of claim 1 wherein retrieving from memory at least one temporary Internet protocol session parameter as corresponds to a node comprises retrieving from memory at least one domain name system session parameter.
- 6. The method of claim 1 wherein retrieving from memory at least one temporary Internet protocol session parameter as corresponds to a node comprises retrieving from memory at least one Internet protocol session compression parameter.

- 7. The method of claim 4 wherein retrieving from memory at least one point-to-point protocol session parameter comprises retrieving from memory at least one point-to-point protocol session parameter as corresponds to a recent point-to-point protocol session as was conducted with the node.
- 8. The method of claim 4 wherein retrieving from memory at least one point-to-point protocol session parameter comprises retrieving from memory a plurality of point-to-point protocol session parameters.
- 9. The method of claim 4 wherein using that at least one temporary Internet protocol session parameter to facilitate initiation of an Internet protocol session with the node comprises using the at least one point-to-point protocol session parameter to negotiate a new point-to-point protocol session with the node.
- 10. The method of claim 1 wherein retrieving from memory at least one temporary Internet protocol session parameter as corresponds to a node comprises only retrieving from memory at least one temporary Internet protocol session parameter as corresponds to a node when the node seeks to facilitate the Internet protocol session within a predetermined period of time following termination of a previous Internet protocol session.
- 11. The method of claim 1 wherein retrieving from memory at least one temporary Internet protocol session parameter as corresponds to a first node comprises retrieving from memory at least one temporary Internet protocol session parameter as corresponds to a node when a second node seeks to communicate with the first node within a predetermined period of time following termination of a previous Internet protocol session.
- 12. The method of claim 1 wherein retrieving from memory at least one temporary Internet protocol session parameter as corresponds to a node comprises retrieving from memory at a packet data serving node at least one temporary Internet protocol session parameter as corresponds to a node.

- 13. The method of claim 1 wherein retrieving from memory at least one temporary Internet protocol session parameter as corresponds to a node comprises retrieving from memory at a remote access server at least one temporary Internet protocol session parameter as corresponds to a node.
- 14. The method of claim 1 wherein retrieving from memory at least one temporary Internet protocol session parameter as corresponds to a node comprises retrieving from memory at a home agent at least one temporary Internet protocol session parameter as corresponds to a node.
- 15. The method of claim 1 wherein retrieving from memory at least one temporary Internet protocol session parameter as corresponds to a node comprises retrieving from memory at a gateway general packet radio service support node at least one temporary Internet protocol session parameter as corresponds to a node.
- 16. A method to facilitate conducting an Internet protocol session comprising:
- conducting a first Internet protocol session with a node using at least one temporary session parameter;
- upon concluding the first Internet protocol session, storing information that corresponds to the at least one temporary Internet protocol session parameter;
- when the node seeks to initiate a second Internet protocol session within a predetermined period of time as corresponds to concluding the first Internet protocol session:
 - retrieving from memory the at least one temporary Internet protocol session parameter;
 - using that at least one temporary Internet protocol session parameter to facilitate the second Internet protocol session.
- 17. The method of claim 16 wherein storing information that corresponds to the at least one temporary Internet protocol session parameter comprises storing information that corresponds to a temporary Internet protocol address as was assigned to the node for the first Internet protocol session.

- 18. The method of claim 16 wherein storing information that corresponds to the at least one temporary Internet protocol session parameter comprises storing information that corresponds to point-to-point protocol session parameters as were negotiated by the node for the first Internet protocol session.
- 19. The method of claim 16 wherein retrieving from memory at least one temporary Internet protocol session parameter as corresponds to a node comprises retrieving from memory at least one domain name system session parameter.
- 20. The method of claim 16 wherein retrieving from memory at least one temporary Internet protocol session parameter as corresponds to a node comprises retrieving from memory at least one Internet protocol session compression parameter.
- 21. The method of claim 16 wherein the predetermined period of time comprises a substantially fixed predetermined period of time.
- 22. The method of claim 21 wherein the substantially fixed predetermined period of time is selected from within a range of candidate periods of time.
- 23. The method of claim 16 wherein the predetermined period of time comprises a dynamically determined period of time.
- 24. The method of claim 23 and further comprising:
- determining the dynamically determined period of time as a function, at least in part, of a time when the first Internet protocol session concludes.
- 25. The method of claim 24 wherein determining the dynamically determined period of time as a function, at least in part, of a time when the first Internet protocol session concludes comprises determining the dynamically determined period of time as a function, at least in part, of a time of day when the first Internet protocol session concludes.

- 26. The method of claim 24 wherein determining the dynamically determined period of time as a function, at least in part, of a time when the first Internet protocol session concludes comprises determining the dynamically determined period of time as a function, at least in part, of a day when the first Internet protocol session concludes.
- 27. The method of claim 23 and further comprising:
- determining the dynamically determined period of time as a function, at least in part, of a prioritization as pertains to the node.
- 28. The method of claim 23 and further comprising:
- determining the dynamically determined period of time as a function, at least in part, of available Internet protocol session resources.
- 29. The method of claim 28 wherein determining the dynamically determined period of time as a function, at least in part, of available Internet protocol session resources comprises determining the dynamically determined period of time as a function, at least in part, of available temporary Internet protocol addresses.
- 30. An Internet protocol session facilitation apparatus comprising:
- an Internet protocol session facilitator;
- a memory having at least one previous temporary Internet protocol session parameter as corresponds to a recently concluded session temporarily stored for no more than a limited time therein as corresponds to a concluded Internet protocol session.
- 31. The Internet protocol session facilitation apparatus of claim 30 wherein the Internet protocol session facilitator comprises a packet data serving node.
- 32. The Internet protocol session facilitation apparatus of claim 30 wherein the Internet protocol session facilitator comprises a remote access server.
- 33. The Internet protocol session facilitation apparatus of claim 30 wherein the Internet protocol session facilitator comprises a home agent.

- 34. The Internet protocol session facilitation apparatus of claim 30 wherein the Internet protocol session facilitator comprises a gateway general packet radio service support node.
- 35. The Internet protocol session facilitation apparatus of claim 30 wherein the Internet protocol session facilitator comprises an authentication, authorization, and accounting node.
- 36. The Internet protocol session facilitation apparatus of claim 30 wherein the Internet protocol session facilitator comprises hang-time means for using the at least one previous temporary Internet protocol session parameter to facilitate a new Internet protocol session for a common node.
- 37. The Internet protocol session facilitation apparatus of claim 36 wherein the hang-time means only uses the at least one previous temporary Internet protocol session parameter to facilitate a new Internet protocol session when the common node seeks to initiate the new Internet protocol session within a predetermined period of time of when a pervious Internet protocol session concluded.
- 38. The Internet protocol session facilitation apparatus of claim 30 wherein the at least one previous temporary Internet protocol session parameter comprises a temporary Internet protocol address.
- 39. The Internet protocol session facilitation apparatus of claim 38 wherein the temporary Internet protocol address comprises a simple Internet protocol address.
- 40. The Internet protocol session facilitation apparatus of claim 30 wherein the at least one previous temporary Internet protocol session parameter comprises at least one point-to-point protocol negotiated session parameter.
- 41. The Internet protocol session facilitation apparatus of claim 30 wherein the at least one previous temporary Internet protocol session parameter comprises:
- a temporary Internet protocol address; and
- at least one point-to-point protocol negotiated session parameter.
